Breaking new ground in how we manage large transport networks: data analytics, AI and real-time simulation prediction

Mohammad Saifuzzaman

Multi-resolution modelling

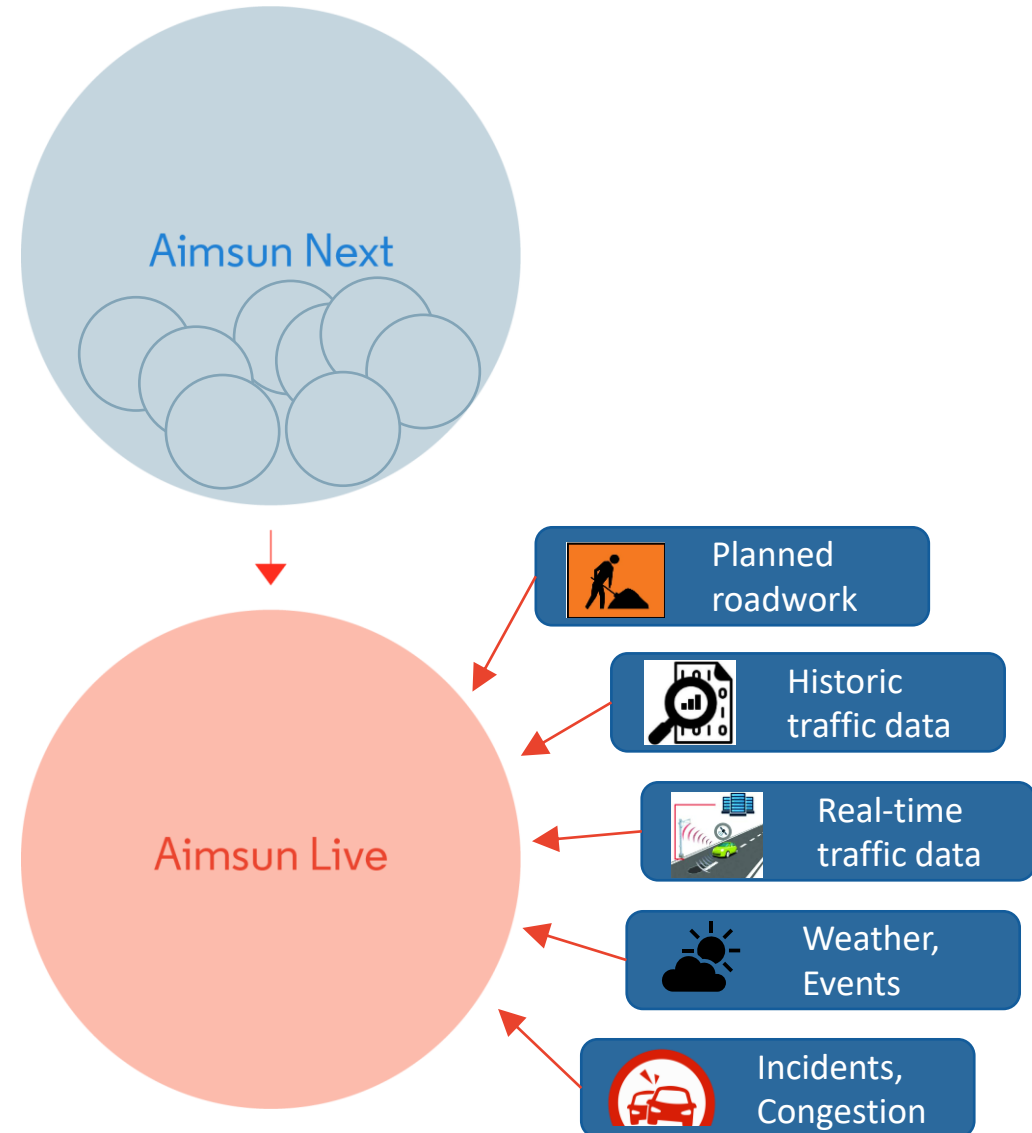

From Aimsun Next to Aimsun Live

Offline

- Micro-meso-macro integration
- Large-scale static and dynamic models
- Faster than real time
- Planning/operational model

Real-time

- Monitoring
- Prediction for next 60-120min
- Decision support

Monitoring

- From a limited set of detectors to a full network coverage

Traffic Monitoring
in Real Time

Quality indicators
Daily reports
Monthly reports

Sensors

Real Time Monitoring t = 8:00:00

Prediction

- Analytical and simulation-based

Traffic Monitoring
in Real Time

Short term simulated
forecasts (for all
sections of the model)

Short term analytical
forecasts (for all
detectors of the model)

Score = 23

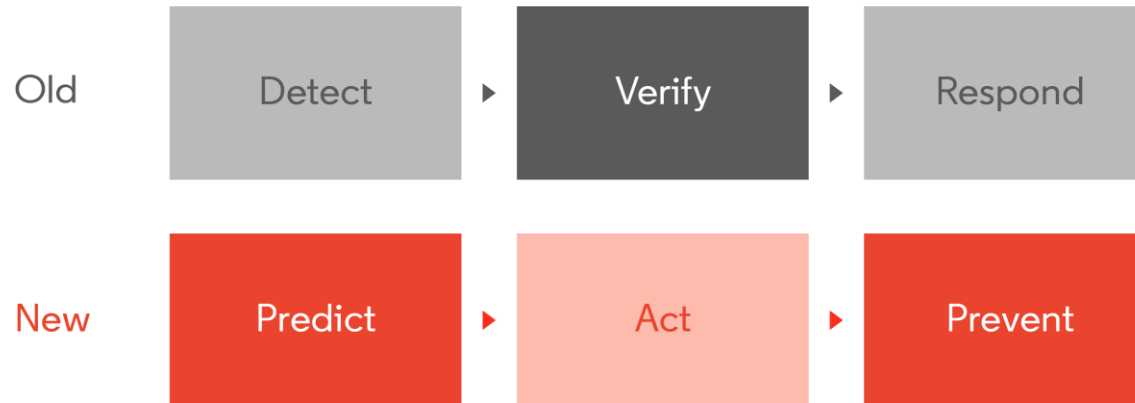

Scenario B
Score = 30

Scenario C
Score = 15

Proactive traffic management

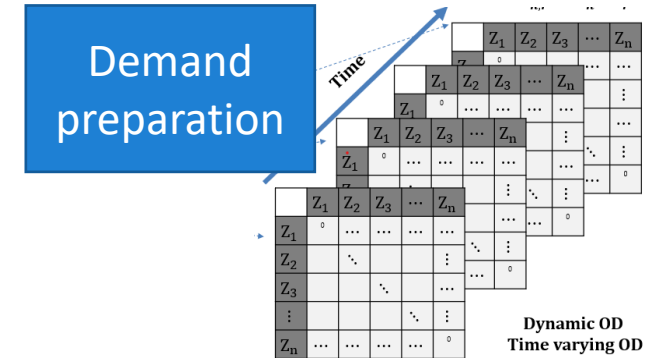

Research to improve Aimsun Live processes

Aimsun Live launches one simulation every 5min

- What demand to go with that simulation
- What routes will the vehicle choose
- What are the optimum network parameters

Research objectives

- Partially automatize model calibration tasks
- Improve model performance
- Faster processes

1-027: Advanced data analytics for real-time demand calibration and prediction in large scale networks

Activity 1: Develop a systematic framework to establish a library of traffic states and OD matrices from real traffic data

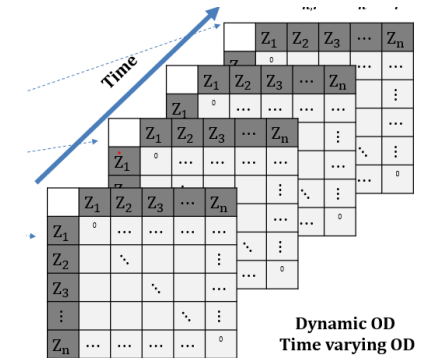

Activity 2: Develop short term traffic demand matching model for real time traffic simulation of urban networks

Activity 3: Enrich simulation model by offline calibration of route choice models using real traffic observations

Activity 4: Integration, testing, and further refinement of the developed modules on TMR node

1-025: Advanced data analytics for real-time demand calibration and prediction in large scale networks

Activity 1: Develop proxy Aimsun Live model for offline development

Activity 2: Develop the AI-assisted calibration module based on data-driven machine learning techniques for analysing disparities between Aimsun Live's model results and observed data

Activity 3: Develop the pattern refinement module that maps traffic patterns with associated optimal parameter set for Aimsun Live

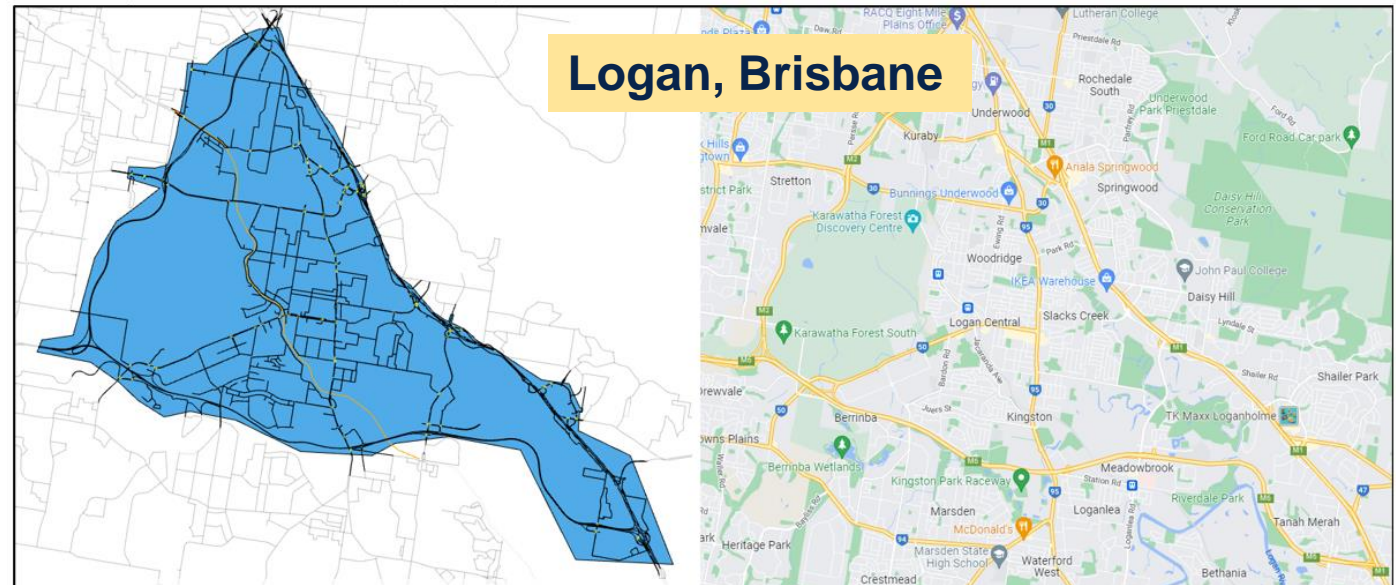

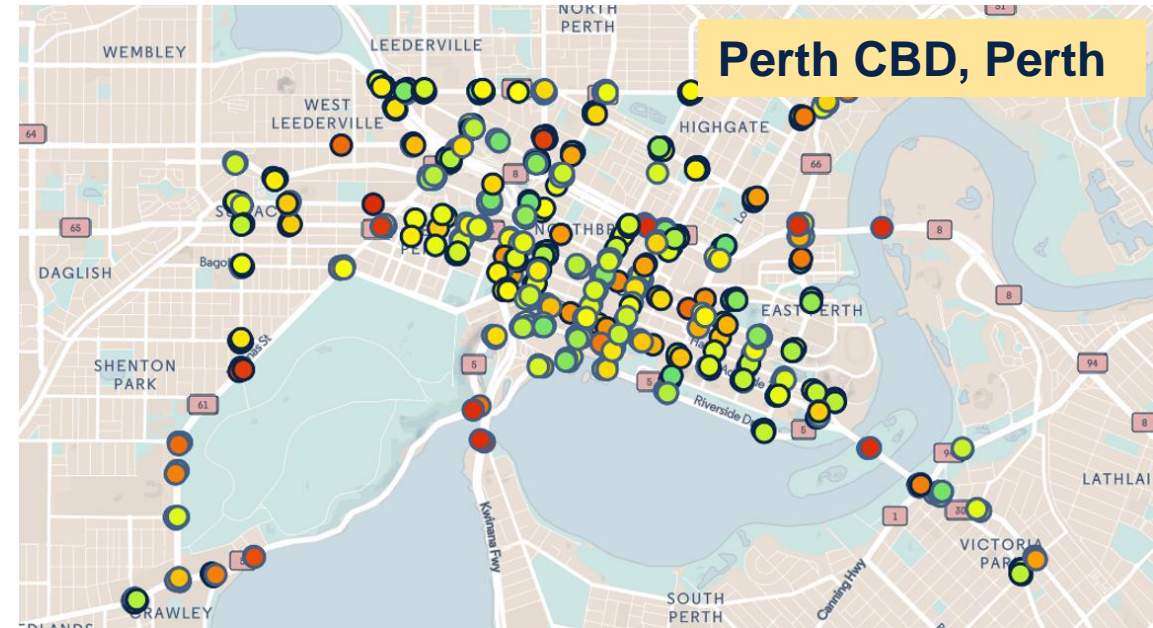

Activity 4: Develop the prediction confidence module

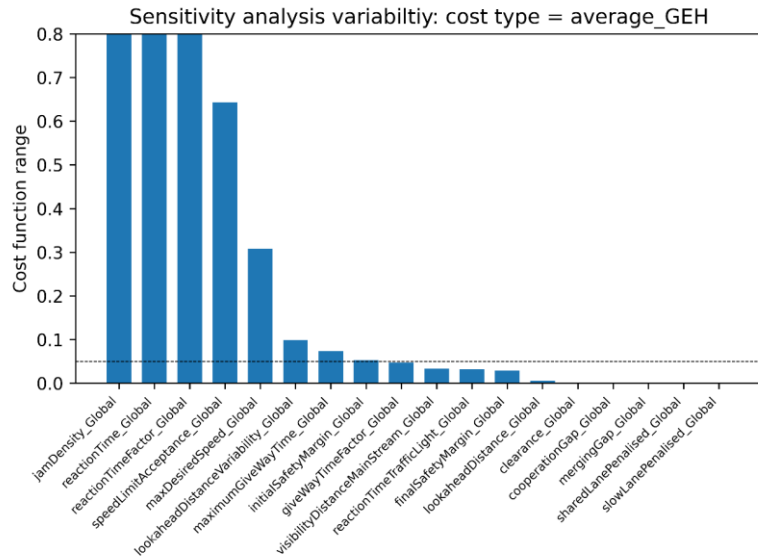

Activity 5: Integration, testing and further refinement of the developed modules

Test bed for the research

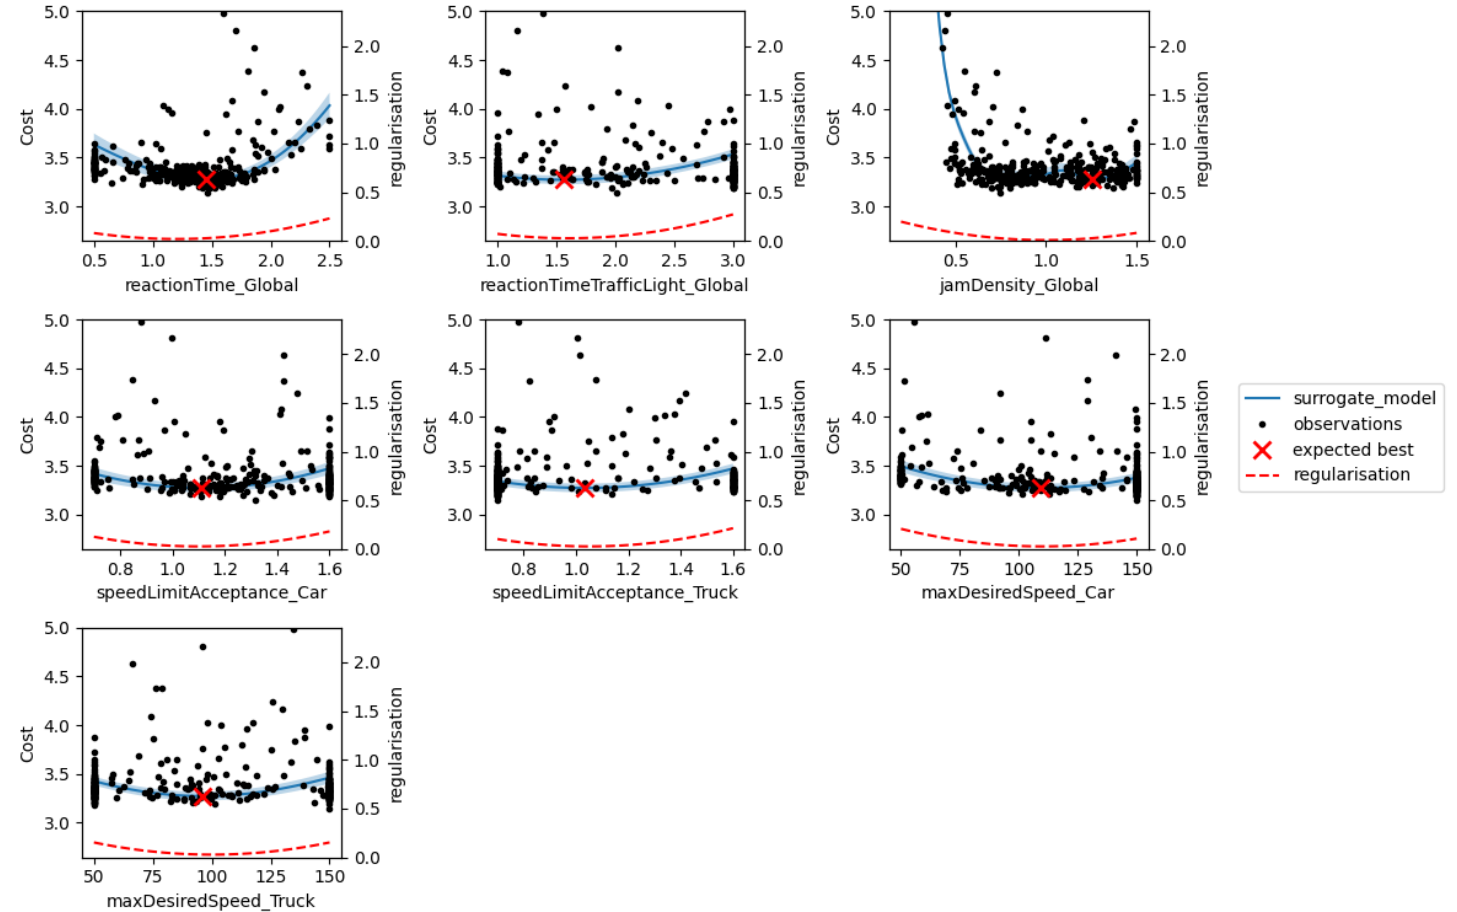

- Aimsun has developed two Aimsun Live test-beds
- Analysed/cleaned the historical data
- Calibrated the base models
- Deployed Aimsun Live pilot for the clients
- Transferred all the historical data, model and related information to the respective universities

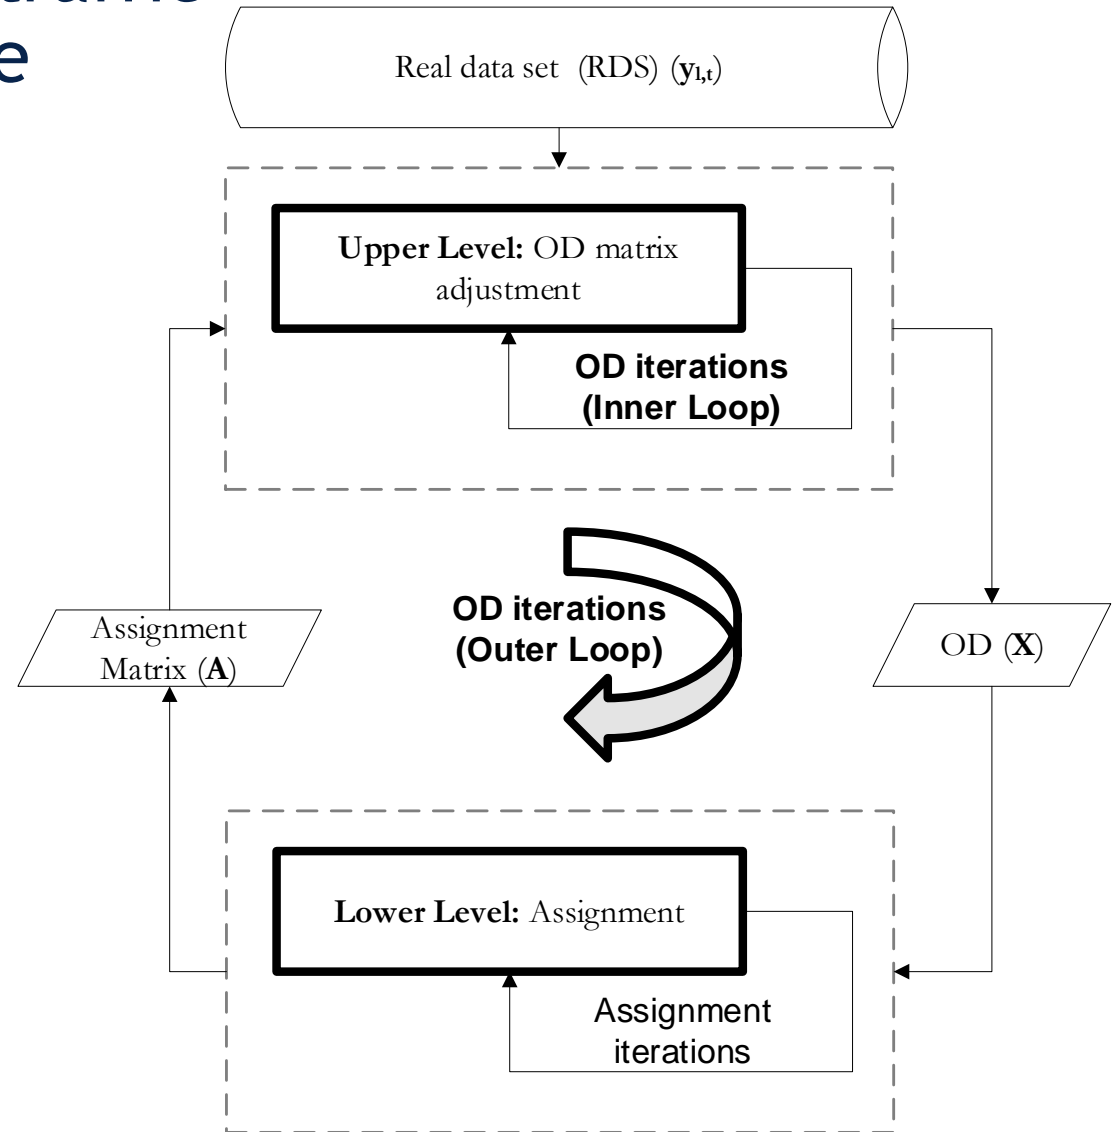

1-025 Activity 2: Develop the AI-assisted calibration module

Simulation start time: 09:00:00. Min of expected: 3.273.

1-027 Activity 2: Develop short term traffic demand matching model for real time traffic simulation

Conclusion

- The research methodologies will be implemented in the Aimsun software/processes
- This should reduce manual model calibration effort
- The model performance for both offline and live models should improve
- These projects shows how we can combine AI, Data analytics and Simulations together to get the best outcome for short term traffic predictions
